                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     44;
                                                                                                                                                                                                                                                       The sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the oligo-dT track served to identify it as a clone from the normalized corpus-striatum library cDNA Library Preparation: M.B. Soares Lab Clone distribution: clones will be available through Research Genetics (www.resgen.com) The following repetitive elements were found in this cDNA sequence: 365-436,
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Coordinated Laboratory for Computational Genomics University of Iowa 375 Newton Road, 4156 MEBRF, Iowa City, IA 52242, Tel: 319 335 8250 Fax: 319 335 9565

Pred. No.

is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., bhred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by MAPPING INFORMATION: This sequence was finished as follows unless otherwise noted: restriction digest.

Mapping information for this clone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. 1 MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc Louis

The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E. Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at http://www.chori.org SOURCE INFORMATION: pBACe3.6 Frengen, E.,

NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the left is RP11-401C13, 2000 bp overlap;
the clone sequenced to the right is RP11-574O17, 2000 bp overlap.
Actual end of this clone is at base position 48999 of RP11-574O17.

Polymorphisms have been identified between AC013272 and AC092603

The sequence of AC073396 has been incorporated into AC092603 Location/Qualifiers clone="RP11-139J6" map="2 'chromosome="2" /mol\_type="genomic Da /db\_xref="taxon:9606" organism="Homo sapiens .22842

The present invention relates to a method for predicting a toxic effect of a compound. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising SEQ ID 1-4925, where differential expression of the gene indicates at least one toxic effect. The method is useful for predicting at least one toxic effect of a compound, predicting hepatotoxicity or the progression of a toxic effect.

Claim 1; SEQ ID NO 4067; 1156pp; English.

The method and compositions of the present invention using a database of genes having liver toxin-induced differential expression, are useful in identifying toxicity markers in liver tissues or cells for drug screening and toxicity assays. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    17-APR-2001; 2001WO-US012575

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC receptor gene (I)-(III) by detecting a polymorphic site, comprising; (a) CC obtaining a sample having a polymorphic of (i) detecting a polymorphic cor alpha2C or fragment or complement of; and (b) detecting a polymorphic cor alpha2C or fragment or complement of; and (b) detecting a polymorphic cor site comprising nucleotide positions 901-909 of (I), a site comprising CC (site comprising nucleotide positions 901-90 of (IIV) or a site comprising (A) (c) (gygygygycy) or (B) (gygygygycy) at positions 961-972 of (III). The CC method may be used for genotyping an alpha2B, alpha2A or alpha2C receptor crisk of developing a disease associated with alpha2B, alpha2A or alpha2, comprising detecting a polymorphic site which correlate to disease and combinations of these. In addition, the technique may be used to predict an individual's response to an alpha2B, alpha2A, or alpha2C agonist (e.g. CC prazosin, ARC 239, rauwolscine, idazoxan, tolazoline, guanabenz, CC (intala04, BHT933 and combinations of these) or antagonist (e.g. yohimbine, CC (combinations of these) by detecting the polymorphic site and correlating combinations of these) by detecting the polymorphic site and correlating combinations of these) by detecting the polymorphic site and correlating combinations of these by detecting the polymorphic site and correlated to phosphate levels). The present sequence is that of the third coff the human alpha-2BAR variant, the sequence is of the wildtwom cene (Antagans)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

Alpha2B-AR has a glutamic acid repeat element (amino acids 298-309) of 12 glutamates, in an acidic stretch of 18 amino acids (amino acids 294-311), located in the third intracellular loop of the receptor polypeptide. The variant is obtained by delection of three glutamates from the Glu repeat (amino acids 307-309). Alpha2B-AR gene is located on chromosome 2. Alpha2-AR mediate many of the physiological effects of the catecholamines, norepinephrine and epinephrine. An antagonist of alpha2B-AR adrenoceptor is useful for treating a mammal suffering from vascular contraction of coronary arteries and a disease involving vascular contraction of coronary arteries which is clinically expressed as coronary heat disease (GDD), unstable chronic angina pectoris which is clinically expressed as Prinzmetal's variant form or acute myocardial infarction (AMI). Alpha2B-AR gene is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New DNA molecule encoding variant specific adrenoceptor protein with deletion of specific amino acids located in the third intracellular loop of the polypeptide, for treating vascular contraction of coronary

                                                                                                              The invention relates to nucleic acids comprising a segment of chemically pretreated DNA of adrenergic alpha-1C-receptor gene. The invention also relates to oligonucleotides or peptide nucleic acid (PNA) oligomers useful for detecting cycosine methylations. The pretreated DNA is useful for the diagnosis or therapy of behavioural disorders, neurological disorders and cancer, in particular major depressive disorder, Tourette's syndrome, schizophrenia, psychiatric and neurological disorders, smoking, immunodeficiency virus dementia, migraine, behaviours in schizophrenic and schizopaffective patients, and suicidal behaviour in patients with schizophrenia. The nucleic acid is useful for detecting the methylation state of all CpG dinucleotides and/or single nucleotide polymorphisms (SNPs). The present sequence is human chemically treated genomic DNA
                                                                                           Sequence

The invention relates to genotyping an alpha-2B, 2A, or 2C adrenergic CC receptor gene (I)-(III) by detecting a polymorphic site, comprising; (a) obtaining a sample having a polymorlectide encoding an alpha-2B, alpha2A or alpha2C or fragment or complement of; and (b) detecting a polymorphic CC site comprising nucleotide positions 901-909 of (I), a site comprising (CC cytosine or guanine at position 753 of (IIV) or a site comprising (A) (19939939930) or (B) (9939939339) at positions 961-972 of (III). The CC gene and further used to determine whether an individual is at increased CC comprising detecting a polymorphic site which correlate to disease associated with alpha2A or alpha2A or alpha2C receptor CC comprising detecting a polymorphic site which correlate to disease and CC compinations of these. In addition, the technique may be used to predict compinations of these. In addition, the technique may be used to predict compinations of these. In addition, the technique may be used to predict compinations of these. In addition, the technique may be used to predict compinations of these or an alpha2B, alpha2A, or alpha2C agonist (e.g. CC UK14304, BHT933 and combinations of these) or antagonist (e.g. yohimbine,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁

An antagonist of alpha2 adrenoceptor is useful for treating a mammal suffering from vascular contraction of coronary arteries and a disease involving vascular contraction of coronary arteries which is clinically expressed as coronary heat disease (CHD), unstable chronic angain pectoris which is clinically expressed as Prinzmetal's variant form or acute myocardial infarction (AMI). Alpha2B-AR gene is used in gene therapy
                                   The invention relates to a method for detecting a risk of hypertension by determining the pattern of alleles encoding a variant alpha-2B-adrenoceptor (AR) protein. The methods and compositions of the invention are useful for detecting risks and targeting treatment for hypertension. The kit is also useful for selecting for clinical drug trials testing the antihypertensive effect of compounds. The present sequence is human alpha
                                                                                                                                                                           Detecting a risk of hypertension and targeting treatment in a subject determining the pattern of alleles encoding a variant alpha-2-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAD44389;

                                                                                                                                                                                                                                                                                                                                                                                                                                                    A genomic DNA clone (AAT59499) codes for human alpha-2B adrenergic receptor (AAW11804), a member of the rhodopsin-like signal transducer family. It was isolated from a human spleen genomic library in the lambda vector Charon 28 by screening with a 1.6 kb fragment of the human 5-hydroxytryptamine receptor gene. Plasmid pNGC-alpha-2B comprising DNA encoding the alpha-2B adrenceptor is deposited as ATCC 68144. Vectors have been adapted to allow prodn. of alpha-2B adrenceptor in bacterial, yeast or mammalian cells; transfected Ltk- cells, designated L-NGC-alpha-2B, are deposited as ATCC CRL 10275. Membranes of such cells can used in novel methods to identify drugs which specifically interact with, and bind to, the alpha-2B adrenergic receptor. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 2064 BP; 319 A; 696 C; 659 G; 390 T; 0

The microarray is particularly useful in the CC diagnosis and treatment of cancer and immunopathology and neuropathology. CC The microarray is useful in diagnostics and treatment regimens, drug CC discovery and development, toxicological and carcinogenicity studies, CC forensics and pharmacogenomics. The microarray is also useful for CC monitoring progression of diseases and for developing sophisticated CC profiles for the effects of currently available therapeutic drugs. The CC combination is also useful for purifying a subpopulation of mRNAs, cDNAs and genomic fragments and in research and diagnostic applications. The CC combination is also useful for purifying a subpopulation of mRNAs, cDNAs and genomic fragments and in research and diagnostic applications. The CC for different signaling pathway populations which can be used to diagnose CC various diseases including cancer e.g. adenocarcinoma and leukaemia, CC immunopathies e.g. AIDS and asthma, neuropathies e.g. Alzheimer's disease and Parkinson's disease. The present sequence represents a polynucleotide probe of the invention. Note: The sequence data for this patent did not C format directly from USPTO at the context of the printed specification but was obtained in electronic CC format directly from USPTO at the context of the printed specification but was obtained in electronic CC format directly from USPTO at the context of the printed specification but was obtained in electronic CC format directly from USPTO at the context of the printed specification but was obtained in electronic CC format directly from USPTO at the context of the printed specification but was obtained in electronic CC format directly from USPTO at the context of the printed specification but was obtained in electronic CC format directly from USPTO at the context of the printed specification but was obtained in electronic context of the printed specification but was obtained in electr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                         The present invention describes antigenic peptides (I) comprising: (a) cany one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino CC acids. Also described: (I) an assay for the detection of a particular GC protein-coupled receptor (GPCR) or a candidate polypeptide in a sample; CC and (2) an isolated antibody having high specificity and high affinity or CC avidity for a particular GPCR. (I) can be used as GPCR modulators and in CC gene therapy. The antigenic peptides for GPCRs are useful in detecting an attibody against a particular GPCR, and in the production of specific CC antibodies. The peptides and antibodies are also useful for detecting the CC presence or absence of corresponding GPCRs. The antigenic peptides for CPCRs and antibodies are useful for diagnosing and designing drugs for CC treating immune-related diseases, growth-related diseases, cell CC diseases, or autoimmune diseases, erouth-related cell proliferative CC diseases, or autoimmune diseases, e.g. AIDS, Alzheimer's disease, CC atherosclerosis, bacterial, fungal, protozoan or viral infections, catherosclerosis, bacterial, fungal, protozoan or viral infections, CC anxiety, depression, schizophrenia, dementia, mental retardation, memory CC loss, epilepsy, asthma, tuberculosis, obesity, nausea, hypertension, cc and other disorder in which GPCRs are involved. The antibodies may be cused in immunoassays and immunodiagnosis. ABZ42523 to ABZ42869 encode CC GPCR proteins given in ABP81675 to ABB82018, which are used in the code code CC GPCR proteins of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is 3' end cDNA of clone 5.31 encoding human melanoma tumour-associated antigen. The cDNA is useful in gene therapy and as an oligonucleotide probe for detecting mRNA coding for the melanoma tumour-associated antigen in a sample. The cDNA is useful for vaccinating an individual who is at risk of getting cancer, suspected of having cancer or has cancer. The present sequence is useful for inhibiting growth of tumour-associated antigen is useful for detection, diagnosis and staging tumour-associated antigen is useful for detection, diagnosis and staging immunotherapy. The identification of novel tumour antigens may allow recurrence and metastatic disease to be detected and disease burden monitored. Characterisation of the melanoma tumour-associated antigen is

CC subject (e.g. cancer), to prevent or inhibit formation of an object (c) by A. funigatus, or to prevent or inhibit formation on a surface of a content content content of an object (c) biofilm comprising A. funigatus. The polynucleotides are useful for coxpressing recombinant protein for characterisation, screening or corganisms invade or reside, for comparing with the pathogenic corganisms invade or reside, for comparing with the buA sequence of A. CC funigatus to identify duplicated genes or paralogues having the same or sequences of other related or distant pathogenic organisms to identify and/or function, for comparing with DNA cc sequences of other related or distant pathogenic organisms to identify potential orthologous essential or virulence genes, for selecting and comparing of other related or distant pathogenic organisms to identify of expression patterns, for raising anti-protein antibodies, as an cc antigen to raise anti-DNA antibodies or to elicit another immune cc with which binding occurs or to identify inhibitors of the binding cc determine levels of the protein in biological fluids, as a marker for comparine levels of the protein in biological fluids, as a marker for isolate correlative receptors or ligands in the case or virulence cc factors. This polynucleotide sequence represents one of the essential xxx.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       organism such subject (e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus fumigatus. The isolated nucleic acids the invention are used to treat or prevent infections by a pathogenian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject e.g. cancer.
